# HOMEWORK #7

**1. How would you link to the named fragment #jobs on the page employ.html from the home page of the site?**

**a. <a href="employ.html#jobs">Jobs</a>**

b. <a name="employ.html#jobs">Jobs</a>

c. <a link="employ.html#jobs">Jobs</a>

d. <a href="#jobs">Jobs</a>

**2. Which pseudo-element can be used to generate content that precedes an element?**

a. :after

**b. :before**

c. :content

d. :first-line

**3. Which of the following is a mobile web design best practice?**

a. Configure a multiple-column page layout.

b. Avoid using lists to organize information.

**c. Configure a single-column page layout.**

d. Embed text in images wherever possible.

**4. Find the Error. The page below is intended for the navigation area to display on the right side of the browser window. What needs to be changed to make this happen?**

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Find the Error</title>
<meta charset="utf-8">
```

```
<style>
body { background-color: #d5edb3;
color: #000066;
font-family: Verdana, Arial, sans-serif; }
nav { float: left;        float: right
width: 120px; }
main { padding: 20px 150px 20px 20px;
background-color: #ffffff;
color: #000000; }
</style>
</head>
<body>
<header role="banner">
<h1>Trillium Media Design</h1>
</header>
<nav role="navigation">
<ul>
<li><a href="index.html">Home</a></li>
<li><a href="services.html">Services</a></li>
<li><a href="contact.html">Contact</a></li>
</ul>
</nav>
<main role="main">
<p>Our professional staff takes pride in its working relationship with our clients by offering
personalized services that listen to their needs, develop their target areas, and incorporate these
items into a website that works.</p>
</main>
</body>
</html>
```

**5. Web research**

Mobile web design and web accessibility are often talked about as different topics, but they actually have a lot in common. Accessibility is about making websites usable for people with disabilities, while mobile design focuses on making websites work well on phones and tablets. In the end, both are trying to do the same thing: make websites easier and more comfortable for people to use.

One clear overlap is how content is organized. When developers use headings, simple layouts, and short paragraphs, it helps everyone. Screen readers can better understand the structure of the page, and mobile users can quickly scan the content without feeling overwhelmed. A well-structured page just makes things easier for all types of users.

Another important point is the use of alternative text for images. Alt text allows people who cannot see images to understand what is being shown. At the same time, it also helps mobile users if images fail to load due to slow internet. In both situations, the user does not miss important information.

Responsive design is also something that connects accessibility and mobile usability. A responsive website adjusts to different screen sizes automatically. This is helpful for mobile users, but it also supports people who need to zoom in or increase text size to read more comfortably. Flexible design makes the website more adaptable for different needs.

Keeping the design simple is another shared idea. Mobile users often deal with small screens and sometimes slow connections, so simple and fast-loading pages are better. Similarly, users with disabilities benefit from clean layouts, clear navigation, and readable text. Too much clutter can confuse users and make the site harder to use.

It is also important to think about how users interact with the site. Not everyone uses a mouse. Some people use a keyboard, and mobile users use touch. This means buttons and links should be easy to click or tap, and navigation should be simple and clear.

Developers can support both accessibility and mobile design by following a few good practices. Using semantic HTML, writing clear content, adding alt text, and building responsive layouts are all helpful steps. Testing the website on different devices is also very important.

Overall, accessibility and mobile web design are closely connected. When developers think about both together instead of separately, they can create websites that work better for everyone, no matter their device or abilities.
